

StayIn: Smart Hostel Search and Booking System

Project Description:

Basic human needs are **food, shelter, and clothing**. A human can survive in any situation if these three are fulfilled.

- For **food**, we already have various applications such as **Zomato, Swiggy, Blinkit, Instamart**, etc. These apps analyze user categories like **veg / non-veg** and items such as **biryani, pizza, noodles, desserts, soft drinks, breakfast**. They further classify results based on **user preferences** like **ratings, availability, price, offers, and taste**.
- For **clothing**, there are multiple applications such as **Amazon, Flipkart, Ajio, Meesho**, etc. Clothing is categorized mainly into **men, women, and children**, and further partitioned into **ethnic, trendy, stylish, vintage, branded**, and refined by **color, size, occasion, rating, and price**.

But when it comes to the third essential need – **shelter** – there is **no dedicated application** that provides an **organized, user-friendly platform** to search, compare, and book **hostels or stays** based on preferences.

Proposed Solution

StayIn is a web-based application designed to fill this gap. It allows users to **search, filter, and book hostels** based on:

- **Type**: Family, Couples, Bachelors, Students
- **Price Range**
- **Ratings & Reviews**
- **Location & Amenities**

The platform provides **pictures, detailed descriptions, and user reviews**, just like food and clothing apps, but focused on **shelter/hostel needs**. Hostel owners can also manage their listings via an **admin dashboard**, making StayIn a **complete ecosystem** for both users and providers.

The platform allows **users** to create accounts, log in, and leave reviews and ratings for hostels they have stayed in, thus creating a community-driven feedback system. Hostel **owners/admins** can add, update, or remove hostel listings through an **admin dashboard**, making management simple and efficient.

To enhance user experience, StayIn integrates **pictures, descriptions, and location details** for each hostel. The system also supports **search and filtering options** that make it easy to quickly find hostels matching the user's budget and lifestyle preferences.
